New highly effective UVC sanitizing technology – try it now!

In the new age of pandemic exposure, the importance of keeping things clean has increased exponentially all over the world. That is why we are happy to announce that our new UVC sanitizing technology has proven extremely effective in recent tests conducted by Eurofins. Contact us today if you're interested in trying it out.

At LightLab Sweden, we truly believe in making sanitization part of our daily life. That is why we have developed a completely new and unique UVC technology that has proven extremely effective in combating germs. In two recent tests conducted by Eurofins, Europe's leading group of laboratories, our technology has been shown to eradicate 99.9 percent (log 3) of all bacteria after only two minutes and 99.9999 percent (log 6) after four minutes. Add to this the facts that our technology is totally mercury-free and offers extremely low temperature dependency. The latter eliminates the need for thermal management, which allows for smooth integration into any chosen design.

Making light work of sanitization

We are now close to global launch and that is why we would like to offer you a unique possibility to try out our technology, test its effectiveness and see how easy it is to integrate into your design.

Are you in need of convenient and effective disinfection or consider integrating UVC into your product? **Contact us today to find out more!**

We look forward to hearing from you
